Big expertise. Real innovation. Solid commitment.

Form Direct's **EnviroBlanket**[™] is the ideal product for providing protection against soil and seed loss.

It is an established fact that one of the best ways to limit and control erosion is by facilitating the growth of vegetation.

EnviroBlanket[™] provide a cover for exposed soil which protects and supports the emerging grass or vegetation until it is established and self-supporting. The function of EnviroBlanket[™] is to protect against wind and rain erosion by covering with a mat of biodegradable material that will later decompose to further assist plant growth.

EnviroBlanket™ is manufactured with a layer of coir/
straw or a mixture of these natural fibres.

The upper and lower sides are stitched with 100 % organic netting and with a Jute or Cotton thread. Alternatively, the blankets can be stitched with Polypropylene netting and thread.

Once applied, EnviroBlanket™ give immediate protection against soil and seed loss caused by wind and rain erosion and promote the establishment of vegetation. Whilst preventing soil compaction and crusting, they also suppress weeds and can form a mulch layer which helps to promote seed germination. Coir naturally absorbs and stores moisture, which is then released to the plants in dry periods. It also conserves moisture in the soil which promotes fast plant development. Water runoff is also slowed by the EnviroBlanket™ which results in silt collection to further aid plant growth and slope stabilisation.

Big expertise. Real innovation. Solid commitment.

The wide range of EnviroBlanket™ cater for an extensive variety of different soil types, slopes, and gradients. Depending on the type of fibre and thickness/weight, they have a life duration of approx. 1-5 years, in which time the vegetation cover will have taken over the task of erosion control.

EnviroBlanket™ is fixed to the soil with steel or wooden pins.

EnviroBlanket™ is produced in accordance with ISO 9001 Quality Control System.
